

Spring Boot REST API 一對多 CRUD 操作範例

Author 在本教程中，我們將示範如何使用 Spring Boot 和 Hibernate 在實體之間建立一對多關係 Book，並透過 REST API 公開 CRUD 操作。

先決條件

1. **Java 開發工具包 (JDK) 17 或更高版本**：確保您的系統上安裝並設定了 JDK。
2. **整合開發環境 (IDE)**：IntelliJ IDEA、Eclipse 或任何其他 IDE。
3. **Maven**：確保您的系統上安裝並設定了 Maven。

步驟 1：創建 Spring Boot 項目

1. 打開你的 IDE 並建立一個新的 Spring Boot 專案。
2. 使用 Spring Initializr 或手動建立 pom.xml 檔案以包含 Spring Boot 和其他所需的依賴項。

```
<project xmlns="http://maven.apache.org/POM/4.0.0"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://maven.apache.org/POM/4.0.0 http://maven.apache.org/xsd/maven-4.0.0.xsd">
    <modelVersion>4.0.0</modelVersion>
    <groupId>com.example</groupId>
    <artifactId>spring-boot-onetomany-example</artifactId>
    <version>1.0-SNAPSHOT</version>

    <parent>
        <groupId>org.springframework.boot</groupId>
        <artifactId>spring-boot-starter-parent</artifactId>
        <version>3.4.4</version>
```

```
<relativePath/>
```

```
</parent>
```

```
<dependencies>
```

```
<dependency>
```

```
<groupId>org.springframework.boot</groupId>
```

```
<artifactId>spring-boot-starter-data-jpa</artifactId>
```

```
</dependency>
```

```
<dependency>
```

```
<groupId>org.springframework.boot</groupId>
```

```
<artifactId>spring-boot-starter-web</artifactId>
```

```
</dependency>
```

```
<dependency>
```

```
<groupId>mysql</groupId>
```

```
<artifactId>mysql-connector-java</artifactId>
```

```
<version>8.0.33</version>
```

```
</dependency>
```

```
</dependencies>
```

```
<build>
```

```
<plugins>
```

```
<plugin>
```

```
<groupId>org.springframework.boot</groupId>
```

```
<artifactId>spring-boot-maven-plugin</artifactId>
```

```
</plugin>
```

```
</plugins>
```

```
</build>
```

```
</project>
```

解釋

- **spring-boot-starter-data-jpa**：包括和 Hibernate 的 Spring Data JPA。
- **spring-boot-starter-web**：包括用於建立 Web 應用程式的 Spring MVC。
- **mysql**：資料庫。

步驟 2：配置應用程式屬性

設定 application.properties 檔來設定 mysql 資料庫。

```
spring.application.name=sbdemo2025
spring.datasource.url=jdbc:mysql://localhost:3306/mydb
spring.datasource.driverClassName=com.mysql.cj.jdbc.Driver
spring.datasource.username=root
spring.datasource.password=1234
spring.jpa.database-platform=org.hibernate.dialect.MySQLDialect
spring.jpa.hibernate.ddl-auto=update
spring.jpa.show-sql=true
spring.jpa.properties.hibernate.format_sql=true
```

步驟 3：建立作者實體類

建立一個名為的套件 com.example.sbdemo 和一個名為的類別 Author。

```
import jakarta.persistence.*;
```

```
import java.util.HashSet;
```

```
import java.util.Set;
```

```
@Entity
```

```
public class Author {
```

```
    @Id
```

```
    @GeneratedValue(strategy = GenerationType.IDENTITY)
```

```
    private Long id;
```

```
    private String name;
```

```
    @OneToMany(mappedBy = "author", cascade = CascadeType.ALL, orphanRemoval = true)
```

```
    private Set<Book> books = new HashSet<>();
```

```
    public Author() {}
```

```
    public Author(String name) {
```

```
        this.name = name;
```

```
    }
```

```
    public Long getId() {
```

```
        return id;
```

```
    }
```

```
    public void setId(Long id) {
```

```
        this.id = id;
```

```
    }
```

```
    public String getName() {
```

```
return name;
```

```
}
```

```
public void setName(String name) {
```

```
    this.name = name;
```

```
}
```

```
public Set<Book> getBooks() {
```

```
    return books;
```

```
}
```

```
public void setBooks(Set<Book> books) {
```

```
    this.books = books;
```

```
}
```

```
public void addBook(Book book) {
```

```
    books.add(book);
```

```
    book.setAuthor(this);
```

```
}
```

```
public void removeBook(Book book) {
```

```
    books.remove(book);
```

```
    book.setAuthor(null);
```

```
}
```

```
@Override
```

```
public String toString() {
```

```
    return "Author{id=" + id + ", name='" + name + "' + 'W' + '}'";
```

```
}
```

```
}
```

解釋

- **@Entity**：將類別標記為實體。
- **@Id**：將該欄位標記為主鍵。
- **@GeneratedValue**：指定產生主鍵值的策略。
- **@OneToMany**：定義與實體的一對多關係 Book。
- **taggedByBook**：指定實體中擁有關係的欄位。
- **cascade**：指定級聯操作。
- **orphanRemoval**：指定是否刪除孤立實體。

步驟 4：建立 Book 實體類

Book 建立一個同名包中的類別。

```
import jakarta.persistence.*;
```

```
@Entity
```

```
public class Book {
```

```
    @Id
```

```
    @GeneratedValue(strategy = GenerationType.IDENTITY)
```

```
    private Long id;
```

```
    private String title;
```

```
@ManyToOne(fetch = FetchType.LAZY)
```

```
@JoinColumn(name = "author_id")
```

```
private Author author;
```

```
public Book() {}
```

```
public Book(String title) {
```

```
    this.title = title;
```

```
}
```

```
public Long getId() {
```

```
    return id;
```

```
}
```

```
public void setId(Long id) {
```

```
    this.id = id;
```

```
}
```

```
public String getTitle() {
```

```
    return title;
```

```
}
```

```
public void setTitle(String title) {
```

```
    this.title = title;
```

```

    }

    public Author getAuthor() {

        return author;

    }

    public void setAuthor(Author author) {

        this.author = author;

    }

    @Override

    public String toString() {

        return "Book{id=" + id + ", title='" + title + 'W' + '}';

    }

}

```

解釋

- **@Entity**：將類別標記為實體。
- **@Id**：將該欄位標記為主鍵。
- **@GeneratedValue**：指定產生主鍵值的策略。
- **@ManyToOne**：定義與實體的多對一關係 Author。
- **@JoinColumn**：指定外鍵列。

步驟 5：建立儲存庫介面

com.example.sbdemo.entity 為 Author 和建立一個名稱為 和 介面的套件 Book。

```

import org.springframework.data.jpa.repository.JpaRepository;

import org.springframework.stereotype.Repository;

```

```
@Repository
```

```
public interface AuthorRepository extends JpaRepository<Author, Long> {}
```

```
import org.springframework.data.jpa.repository.JpaRepository;
```

```
import org.springframework.stereotype.Repository;
```

```
@Repository
```

```
public interface BookRepository extends JpaRepository<Book, Long> {}
```

步驟 6：建立服務類

建立一個名為 `com.example.sbdemo.service` 的套件和的服務類別 `Author` 和 `Book`。

```
import org.springframework.beans.factory.annotation.Autowired;
```

```
import org.springframework.stereotype.Service;
```

```
import java.util.List;
```

```
@Service
```

```
public class AuthorService {
```

```
    @Autowired
```

```
    private AuthorRepository authorRepository;
```

```
    public Author save(Author author) {
```

```
return authorRepository.save(author);
```

```
}
```

```
public List<Author> findAll() {
```

```
return authorRepository.findAll();
```

```
}
```

```
public Author findById(Long id) {
```

```
return authorRepository.findById(id).orElse(null);
```

```
}
```

```
public void deleteById(Long id) {
```

```
authorRepository.deleteById(id);
```

```
}
```

```
public Author addBook(Long authorId, Book book) {
```

```
Author author = findById(authorId);
```

```
if (author != null) {
```

```
author.addBook(book);
```

```
return save(author);
```

```
}
```

```
return null;
```

```
}
```

```
public Author removeBook(Long authorId, Long bookId) {
```

```
Author author = findByld(authorId);
```

```
if (author != null) {
```

```
    Book book = author.getBooks().stream().filter(b ->
```

```
b.getId().equals(bookId)).findFirst().orElse(null);
```

```
    if (book != null) {
```

```
        author.removeBook(book);
```

```
        return save(author);
```

```
    }
```

```
}
```

```
return null;
```

```
}
```

```
}
```

```
import org.springframework.beans.factory.annotation.Autowired;
```

```
import org.springframework.stereotype.Service;
```

```
import java.util.List;
```

```
@Service
```

```
public class BookService {
```

```
    @Autowired
```

```
private BookRepository bookRepository;
```

```
public Book save(Book book) {
```

```
    return bookRepository.save(book);
```

```
}
```

```
public List<Book> findAll() {
```

```
    return bookRepository.findAll();
```

```
}
```

```
public Book findById(Long id) {
```

```
    return bookRepository.findById(id).orElse(null);
```

```
}
```

```
public void deleteById(Long id) {
```

```
    bookRepository.deleteById(id);
```

```
}
```

```
}
```

步驟 7：建立控制器類

為和建立一個包含 `com.example.controller` 和 控制器類別的套件。 `AuthorBook`

```
import org.springframework.beans.factory.annotation.Autowired;
```

```
import org.springframework.web.bind.annotation.*;
```

```
import java.util.List;
```

```
@RestController
```

```
@RequestMapping("/authors")
```

```
public class AuthorController {
```

```
    @Autowired
```

```
    private AuthorService authorService;
```

```
    @PostMapping
```

```
    public Author createAuthor(@RequestBody Author author) {
```

```
        return authorService.save(author);
```

```
    }
```

```
    @GetMapping
```

```
    public List<Author> getAllAuthors() {
```

```
        return authorService.findAll();
```

```
    }
```

```
    @GetMapping("/{id}")
```

```
    public Author getAuthorById(@PathVariable Long id) {
```

```
        return authorService.findById(id);
```

```
    }
```

```
@DeleteMapping("/{id}")
```

```
public void deleteAuthor(@PathVariable Long id) {
```

```
    authService.deleteById(id);
```

```
}
```

```
@PostMapping("/{authorId}/books")
```

```
public Author addBook(@PathVariable Long authorId, @RequestBody Book book) {
```

```
    return authService.addBook(authorId, book);
```

```
}
```

```
@DeleteMapping("/{authorId}/books/{bookId}")
```

```
public Author removeBook(@PathVariable Long authorId, @PathVariable Long bookId) {
```

```
    return authService.removeBook(authorId, bookId);
```

```
}
```

```
}
```

```
import org.springframework.beans.factory.annotation.Autowired;
```

```
import org.springframework.web.bind.annotation.*;
```

```
import java.util.List;
```

```
@RestController
```

```
@RequestMapping("/books")
```

```
public class BookController {
```

```
    @Autowired
```

```
    private BookService bookService;
```

```
    @PostMapping
```

```
    public Book createBook(@RequestBody Book book) {
```

```
        return bookService.save(book);
```

```
    }
```

```
    @GetMapping
```

```
    public List<Book> getAllBooks() {
```

```
        return bookService.findAll();
```

```
    }
```

```
    @GetMapping("/{id}")
```

```
    public Book getBookById(@PathVariable Long id) {
```

```

        return bookService.findById(id);
    }

    @DeleteMapping("/{id}")

    public void deleteBook(@PathVariable Long id) {

        bookService.deleteById(id);
    }
}

```

步驟 8：建立主應用程式類

建立一個名為的套件 `com.example` 和一個名為的類別 `SpringBootOneToManyExampleApplication`。

```

package com.example;

import org.springframework.boot.SpringApplication;

import org.springframework.boot.autoconfigure.SpringBootApplication;

@SpringBootApplication

public class SpringBootOneToManyExampleApplication {

    public static void main(String[] args) {

        SpringApplication.run(SpringBootOneToManyExampleApplication.class, args);
    }
}

```

步驟 9：運行應用程式

1. 運行該 `SpringBootOneToManyExampleApplication` 課程。

2. 使用 API 用戶端 (例如 Postman) 或 Web 瀏覽器來測試端點。

測試端點

1. 創建作者：

- 網址：POST /authors
- 身體:

```
{  
  "name": "George Orwell"  
}
```

2. 創建書籍：

- 網址：POST /books
- 身體:

```
{  
  "title": "1984"  
}
```

- 身體:

```
{  
  "title": "Animal Farm"  
}
```

3. 新增書籍至作者：

- 網址：POST /authors/{authorId}/books
- 身體:

```
{  
  "title": "1984"  
}
```

```
}
```

- 身體:

```
{
```

```
  "title": "Animal Farm"
```

```
}
```

4. 取得所有作者：

- 網址：GET /authors

5. 透過 ID 取得作者：

- 網址：GET /authors/{id}

6. 取得所有書籍：

- 網址：GET /books

7. 透過 ID 取得書籍：

- 網址：GET /books/{id}

8. 根據 ID 刪除作者：

- 網址：DELETE /authors/{id}

9. 根據 ID 刪除圖書：

- 網址：DELETE /books/{id}

結論

您已成功使用 Spring Boot 和 Hibernate 建立了一個範例，以示範電子商務環境中的一對多關係。本教學介紹如何設定 Spring Boot 專案、配置 Hibernate、建立具有一對多關係的實體類別以及透過 RESTful 端點執行 CRUD 操作。
